

## **Personal Reflections**

### **Iteration plan**

I searched on the internet to know what the iteration plan should include. Finally, I found that the most important information that might be included are the iteration period, iteration objectives(goals) and the iteration activities.

I tried to divide the whole project in iterations, first iteration focuses on planning, analysing and designing. And I decided to starting the implementation in this iteration that will be continued in the next iterations.

The second and the third iteration include the implementation of the rest of the cases.

### **Test cases**

Please take in consider that we don't received feedback on the assignment 3 so I don't know if the test cases are right or there is something missed

My programming background isn't enough to implement the API tests and to implement the rest of the use cases with JUnit.

The two tests in `src>test>java` can't be performed together because the delete functions that will be executed in the test will affect the expected results of the other tests so run one test each time and copy the original `book.xml` file again after each run of the code
